There have now been 2,433 fetal deaths recorded in VAERS (Vaccine Adverse Event Reporting System) from pregnant women who have been injected with one of the COVID-19 shots. ([Source](#).)

The vast majority of these have been from the Pfizer shot (1,862 deaths) and the Moderna shot (656 deaths.)

There have been more fetal deaths in the past 11 months following COVID-19 shots than there have been for the past 30+ years following ALL vaccines ([2,198 - Source](#).)

Last month (October, 2021) the *New England Journal of Medicine* admitted that the original study used to justify the CDC and the FDA in recommending the shots to pregnant women was flawed. ([Source](#).)

Since then, researchers in New Zealand have conducted [a new study](#) on the original data, and concluded:

A re-analysis of these figures indicates a cumulative incidence of spontaneous abortion ranging from 82% (104/127) to 91% (104/114), 7-8 times higher than the original authors’ results. ([Source](#).)

And yet, the CDC and FDA still continue to recommend the shots for pregnant women, even though a correct analysis on the original data shows that 82% to 91% of pregnant women will suffer miscarriages if their unborn child is less than 20 weeks old. ([Source](#).)

VAERS is a passive system that is severely under reported. The CDC and FDA have never conducted a study to determine what this under-reported factor is, but independent scientists have, and we have previously published the analysis conducted by Dr. Jessica Rose, who has determined that a conservative under-reported factor would be X41.

See: [STUDY: Government's Own Data Reveals that at Least 150,000 Probably DEAD in U.S. Following COVID-19 Vaccines](#)

This means that there have probably been at least 99,753 fetal deaths following COVID-19 injections so far.

Here is a video report we made on this last month with some very unfortunate gruesome examples of what these shots are doing to unborn babies.
