

666 Cases of Heart Disease in 12 to 17-Year-Olds after COVID Shots - Less than 2 Cases Per Year Following All Vaccines for Past 30+ Years

The COVID-19 shots cause heart disease, mainly myocarditis and pericarditis, which is destroying the health of our young people.

This is a fact that is no longer in dispute, as even the CDC admits this, as [their most recent report](#) states:

As of November 24, 2021, VAERS has received 1,949 reports of myocarditis or pericarditis among people ages 30 and younger who received COVID-19 vaccine. Most cases have been reported after mRNA COVID-19 vaccination (Pfizer-BioNTech or Moderna), particularly in male adolescents and young adults. ([Source](#).)

The only debatable points are, 1, whether or not these cases are “rare,” and 2, if the benefits of COVID-19 mass vaccination of young people outweigh the risk for heart disease.

And it is on these two points that the CDC is lying to the public, as I will conclusively prove in this article.

The second point is actually very easily debunked, by simply looking at publicly available statistics on COVID-19 deaths for this age group.

Number of coronavirus disease 2019 (COVID-19) deaths in the U.S. as of December 1, 2021

[Source.](#)

As of December 1, 2021, out of 779,402 alleged COVID-19 deaths covering almost 2 years now, only 630 of those were under the age of 17.

And even those 630 alleged deaths in this age group are not necessarily caused by COVID-19. It just means that when they died, they tested positive for COVID-19.

So there is no benefit to vaccinating children under the age of 17 for COVID-19 when they have almost a statistically zero percent chance of dying from COVID-19, when it is known that these shots cause heart disease.

As to the claim by the CDC that instances of heart disease caused by COVID-19 shots are "rare," the factual evidence states otherwise.

I ran a search in VAERS, the U.S. Government's *Vaccine Adverse Events Reporting System*, for all cases of "carditis" following COVID-19 shots for this age group, and from the 11/26/2021 release of VAERS data, it returned a result of 666 cases. ([Source.](#))

Search Results

From the 11/26/2021 release of VAERS data:

Found 666 cases where Age is 12-or-more-and-under-17 and Vaccine is COVID19 and Symptom is *carditis

Table

		↓	↑ ↓
Age	Event Outcome	Count	Percent
12-17 Years	Death	2	0.3%
	Permanent Disability	11	1.65%
	Office Visit	155	23.27%
	Emergency Doctor/Room	229	34.38%
	Hospitalized	509	76.43%
	Hospitalized, Prolonged	1	0.15%
	Recovered	203	30.48%
	Birth Defect	1	0.15%
	Life Threatening	64	9.61%
	Not Serious	39	5.86%
	total	1,214	182.28%
TOTAL		† 1,214	† 182.28%
† Because some cases have multiple vaccinations and symptoms, a single case can account for multiple entries in this table. This is the reason why the Total Count is greater than 666 (the number of cases found), and the Total Percentage is greater than 100.			

Next, I preformed the exact same search for the same age group excluding COVID-19 shots and including all other vaccines listed in VAERS for the past 30+ years, and it returned a value of 40 cases, less than 2 cases per year. ([Source.](#))

Search Results

From the 11/26/2021 release of VAERS data:

Found 40 cases where Age is 12-or-more-and-under-17 and Vaccine is ALL and Symptom is *carditis and Vaccination Date on/before '2020-11-30'

Table			
		↑	↓
Age	Event Outcome	Count	Percent
12-17 Years	Death	8	20%
	Permanent Disability	2	5%
	Emergency Room	16	40%
	Hospitalized	22	55%
	Hospitalized, Prolonged	3	7.5%
	Recovered	10	25%
	Life Threatening	10	25%
	Not Serious	3	7.5%
	total	74	185%
TOTAL		† 74	† 185%
† Because some cases have multiple vaccinations and symptoms, a single case can account for multiple entries in this table. This is the reason why the Total Count is greater than 40 (the number of cases found), and the Total Percentage is greater than 100.			

Keep in mind that the 666 cases in this age group following COVID-19 shots are for only 6 months for 12 to 15-year-olds in the U.S., as the Pfizer shot was only given emergency use authorization for that age group in May of this year (2021).

Children between the ages of 5 and 11 were just given emergency use authorization last month, November, 2021, but there are already 2 cases of heart disease also reported in this age group, a 6-year-old and 8-year-old, both boys. ([Source.](#))

By whose definition are these cases of heart disease in these children “rare”?

Circulation

An American Heart Association Journal

British Cardiologist Confirms AHA Study: Whistleblowers Confirm COVID-19 Shots Lead to Increased Heart Attacks

We reported a couple of weeks ago that the American Heart Association journal, *Circulation*, published an abstract from a cardiologist, Steven R Gundry, that claims getting COVID-19 shots “Dramatically Increases” the risk for heart attacks.

UK medical doctor Vernon Coleman, in referencing the study, stated: [Finally! Medical Proof the Covid Jab is “Murder”](#). See: [American Heart Association Journal Publishes Data that UK Medical Doctor Claims are “Proof” that COVID-19 Vaccines are “Murder”](#)

Dr. Aseem Malhotra, another cardiologist from the UK, confirmed the results of the AHA study and shared that British authorities in the field of Cardiology confirmed to him that this is happening, that the COVID-19 shots are leading to increased heart attacks, but they are afraid to go public because they will lose their research funding from the Drug Companies.

He called for an immediate end to vaccine mandates. Watch the interview, which is on our [Bitchute channel](#).

Ben Madgen: Former Pro-Basketball Player in Australia. [Image source](#).

[The COVID World recently reported](#) that former Australian pro-basketball player Ben Madgen has been diagnosed with pericarditis (inflammation of the sac surrounding the heart) shortly after receiving his second dose of the Pfizer COVID-19 vaccine.

The Australian doctors who treated him apparently disagree with the CDC that this is a “rare” side effect, as they told him that pericarditis is now a common side effect of the Pfizer shot for young males.

There are so many reports now of athletes and other young males suffering from heart attacks since the COVID-19 shots have started, that medical authorities had to try to come up with a different explanation to deflect attention away from the deadly COVID-19 shots.

So they invented a new disease: “post-pandemic stress disorder.”

Up to 300,000 people in the UK are facing heart-related illnesses due to post-pandemic stress disorder (PPSD), two London physicians have warned.

This could result in a 4.5 per cent rise in cardiovascular cases nationally because of the effects of PPSD, with those aged between 30 to 45 most at-risk, they claim.

Mark Rayner, a former senior NHS psychological therapist and founder of EASE Wellbeing CIC, said that as many as three million people in Britain are already suffering from PPSD, thanks to stress and anxiety caused by the effects of Covid-19. ([Source](#).)

You can't make this stuff up!

If adults want to be stupid enough to believe this nonsense and risk taking a COVID-19 shot, that is their choice.

But minor children are subject to the choices of their parents, so please do NOT give your child a COVID-19 shot!

Heed the warning from these parents who now regret their children getting one of these shots because their child is now dead, or suffering with heart disease.
