Workers unearth barrels at the Kadena Air Base, January 2014.

More than six months after dozens of rusty chemical barrels were unearthed from former U.S. military land in Okinawa City, their contents have been identified – and they appear to offer conclusive proof that the toxic Vietnam War defoliant Agent Orange was buried on the island.

Announced in early July, the results of two separate studies – one conducted by Okinawa City and one by the Okinawa Defense Bureau – both detected the three signature components of Agent Orange: the herbicides 2,4,5-T and 2,4-D as well as highly-toxic TCDD dioxin. This is the first time that all three ingredients have been discovered on ex-Pentagon property on Okinawa.

About half of the 61 barrels also bore markings from the Dow Chemical Company – one of the largest manufacturers of Agent Orange for the U.S. military.

Commenting on the results, defoliant expert, Wayne Dwernychuk, stated, “The presence of 2,4,5-T, that portion of Agent Orange containing TCDD and 2,4-D, the other half of the Agent Orange mixture, unequivocally defines at least some of the media sampled as being contaminated with this defoliant. Dow Chemical markers on the drums further contribute to this conclusion that the original contents of some of these drums was Agent Orange.”

Likewise, Honda Katsuhisa, an Ehime University professor specializing in defoliants and dioxins, asserted that the results proved without doubt that defoliants had been buried at the dumpsite.²

The Pentagon denies that Agent Orange was ever present on Okinawa despite testimony from more than 250 U.S. veterans who claim they were sickened by the defoliant on the island during the Vietnam War era.³ A 1971 U.S. government report on Agent Orange cites the presence of a herbicide stockpile at Kadena; the site where the 61 barrels were buried was part of Kadena Air Base, one of the Pentagon’s primary transport hubs for the Vietnam

War, until restored to civilian usage in 1987.

According to the data released by Okinawa City, all 61 barrels contained traces of dioxin and standing water near the barrels showed dioxin at levels 64 times the environmental standard. However dioxin readings from the soil were below maximum permitted limits and there was no evidence of contamination of the water table.

Twenty of the barrels also contained traces of toxic polychlorinated biphenyls (PCBs).

Although the Okinawa Defense Bureau's tests detected Agent Orange's three tell-tale ingredients, the department seemed keen to distance itself from conclusions that the barrels had contained the Vietnam War defoliant. Its report – released on July 7 – included statements that the barrels were not labeled as defoliants and that 2,4,5-T was widely-used as a herbicide at the time in Japan.⁵

Noguni Masaharu, the Mayor of neighboring Chatan Town, told Okinawan journalists, "The Okinawa Defense Bureau says it cannot conclude that these are defoliants but local residents' worries haven't been dispelled. There is testimony from U.S. veterans (about Agent Orange on Okinawa). It should investigate the full extent of the toxic substances and remove them."⁶

Contacted in July for comment on the test results, USFJ director of public affairs, Lt Col. David Honchul, stated that the U.S. military had not yet received the surveys.

Last year more than 20 other barrels were unearthed from the same area. Those barrels also contained high levels of dioxin – causing concerns among U.S. parents whose children attend two on-base schools adjacent to the dumpsite. In response to their demands, Kadena officials conducted surface soil samples of the school playing fields and concluded that they posed no risk to human health.

However, the new findings reignited parents' worries.

"In light of the latest test results, I hope Kadena officials might be willing to acknowledge that base and local residents' concerns about potential exposure (both past and present) to dangerous chemicals are legitimate. We want to know if they are now going to change their stance and do something that will give residents a greater reassurance of their safety," said Jannine Myers, whose child until recently attended one of the on-base schools.

At a town hall meeting held on Kadena Air Base in January, 18th Wing Commander Brig. Gen. James Hecker reassured parents that he would do all he could to protect the safety of

military families and he pledged to be more forthcoming with information. However the USFJ have hampered subsequent attempts under the Freedom of Information Act to obtain the documents upon which he – and USFJ spokesperson Honchul – based statements related to prior usage of the land where the barrels were unearthed.

The discovery of the barrels is the latest in a number of incidents this year which have raised doubts about health and safety practices on Kadena Air Base. In March, it was learned that base officials had kept secret a large spill of PCBs in the late 1980s. Meanwhile in May, Air Force officials admitted that drinking fountains in a building used to check children for developmental problems were dispensing water contaminated with lead. The poisoning had continued from 2010 to 2014 and it is unknown how many people have been affected.⁷

The burial of surplus chemicals – including Agent Orange – was standard operating procedure for the U.S. military on Okinawa according to veterans. Large caches of barrels suspected to have been defoliants were uncovered on MCAS Futenma in 1981 and on former military land in Chatan in 2002.⁸ In neither case were tests for Agent Orange conducted.

Now Japanese authorities plan to widen the scale of excavation work in Okinawa City to determine whether any other barrels are buried in the area.

Under the U.S.-Japan Statutes of Forces Agreement (SOFA), the U.S. military is not obliged to clean up any pollution created by its bases. However growing public anger over military contamination has prompted Washington and Tokyo to take action. In late June, the fourth round of meetings to discuss supplementing SOFA with environmental clauses was held in the U.S.⁹
