

Coronavirus Fact-Check: Why “New Cases” Are Plummeting

The number of “new cases” reported is tumbling in many countries around the world, and has been for over a month. So what’s causing it?

The scary red numbers [are all going down](#). Check any newspaper or covid tracking website you want. Cases. Deaths. Hospitalisations. They’re all going down, sharply, and have been for weeks, especially in the US and UK.

So, why would that be?

Pundits across the media world have made suggestions – from vaccines to lockdowns – but there’s only one that makes any real sense.

It’s Not Vaccines

The assumption most people would make, and would be encouraged to make by the talking heads and media experts, is that the various “vaccines” have taken effect and stopped the spread of the “virus”.

Is this the case? No, no it’s not.

The decline started in mid-January, far too early for any vaccination program to have any effect. Many experts [said as much](#):

Dr. Wafaa El-Sadr, professor of epidemiology and medicine at Columbia University’s Mailman School of Public Health, said the falling case numbers can’t be attributed to the COVID-19 vaccine, because not even a tenth of the population has been vaccinated, according to the CDC.

Further, the drop is happening simultaneously in different countries all around the world, and not every country is vaccinating at the same rate or even using the same vaccine. So no, the “vaccines” are not causing the drop.

It’s Not Lockdown Either

Another suspect is the lockdown, with [blaring propaganda](#) stating that all the various government-imposed house arrests and “distancing” measures have finally had an impact.

That’s not it either.

Sweden, famously, never locked down at all. Yet their “cases” and “Covid related deaths” have been dropping exactly in parallel with the UK:

Clearly, if countries that never locked down are also seeing declines in case numbers, the lockdown cannot be causing them.

So what is?

The WHO PCR Test Guidelines

Maybe for our answer, we should look at the date the decline started.

Observe this graph:

As you can see, the global decline in “Covid deaths” starts in mid-to-late January.

What else happened around that time?

Well, on January 13th the WHO [published a memo](#) regarding the problem of *asymptomatic cases being discovered by PCR tests*, and suggesting any asymptomatic positive tests be repeated.

This followed up on their previous memo, [instructing labs around the world to use lower cycle thresholds](#) (CT values) for PCR tests, as *values over 35 could produce false positives*.

Essentially, in two memos the WHO ensured future testing would be less likely to produce false positives and made it much harder to be labelled an “asymptomatic case”.

In short, logic would suggest we’re not in fact seeing a “decline in Covid cases” or a “decrease in Covid deaths” at all.

What we’re seeing is a decline in perfectly healthy people being labelled “covid cases” based on a false positive from an unreliable testing process. And we’re seeing fewer people dying of pneumonia, cancer or other disease have “Covid19” added to their death certificate based on testing criteria designed to inflate the pandemic.

Just as we at [OffG predicted would happen](#) the moment the memo was published.
