We reported in 2011 that the International Atomic Energy Agency [knew within weeks](#) that Fukushima had melted down ... but failed and refused to tell the public.

The same year, we reported in 2011 that the U.S. [knew within days](#) of the Fukushima accident that Fukushima had melted down ... but failed to tell the public.

We [noted](#) in 2012:

The fuel pools and rods at Fukushima appear to have “boiled”, caught fire and/or exploded soon after the earthquake knocked out power systems. See [this](#), [this](#), [this](#), [this](#) and [this](#).

Now, a declassified report written by the U.S. Nuclear Regulatory Commission on March 18, 2011 – one week after the tidal wave hit Fukushima – [states](#):

The source term provided to NARAC was: (1) 25% of the total fuel in unit 2 released to the atmosphere, (2) 50% of the total spent fuel from unit 3 was released to the atmosphere, and (3) 100% of the total spent fuel was released to the atmosphere from unit 4.

 NARAC is the the U.S. National Atmospheric Release Advisory Center, located at the University of California’s Lawrence Livermore National Laboratory. NARAC “[provides tools and services that map the probable spread of hazardous material accidentally or intentionally released into the atmosphere](#)”.

The fuel pools at Units 3 and 4 contained [enormous amounts](#) of radiation.

For example, there was “[more cesium in that \[Unit 4\] fuel pool than in all 800 nuclear bombs exploded above ground.](#)”
