Do cell phones, Bluetooth devices, WiFi and other wireless tech cause cancer or is it just another “coincidence” that tin-foil hat conspiracy theorists are sharing on their smartphones?

Let me tell you about such a “coincidence” I witnessed firsthand...

Many years ago, I hired a young lady to help out around the apartment and in the office, as my wife was quite ill and I was already working seven days a week (still am, I guess). The new assistant came in six days a week for a few hours and completed a long list of items in record time. The whole time she’d be singing and was a joy to have around.

Until, after about six months, she began slowing down and making mistakes. I asked her what was up. She said she was having trouble getting to sleep and staying asleep at night.

I asked her a few questions about her sleeping arrangements. It turned out to be an EMF nightmare: she and her husband both slept in a small, loft room, upon a large futon on the floor with a tin roof above them. On either side of their bed, they each had their laptops and their smartphones active, recharging and certainly not in airplane mode. They also kept their WiFi blasting all night.

I suggested that maybe they should experiment and get all the tech out of their sleeping chamber and kill the WiFi at night.

She looked at me like I had suggested they move out to the wilderness and live in a cave.

I then told her about the [\\$30 million, ten-year study](#) the US Department of Health and Human Services conducted, exposing rats to 2G and 3G cellphone radiation. I believe the scientists were trying to prove that wireless tech was harmless.

Their experiment failed.

The study concluded

“there is clear evidence that male rats exposed to high levels of radio frequency radiation (RFR) like that used in 2G and 3G cell phones developed cancerous heart tumors, according to [final reports](#) released today. There was also some evidence of tumors in the brain and adrenal gland of exposed male rats.”

She told me that she wasn't worried about that and Jesus would heal her if she got cancer.

Well, you can't argue with faith. So I didn't mention it again.

Fast forward a few months and she'd become quite sick — throwing up and having to lie down after an hour of work. She had to quit.

A week later, she emailed to let us know that she had cancer and was beginning chemotherapy. The doctors found one tumour on her heart (just like the rats in the study) and the other in her neck.

Coincidence? Sure. Just like getting vaccinated and dying suddenly is a coincidence.

There is a pile of studies, such as the above, showing that EMFs from wireless tech affect our physical and mental health. It's not a tin-foil hat theory (in fact, wearing a tin-foil hat would turn your head into an EMF antenna).

Of course, Apple, Facebook and Samsung don't want you to know that these addictive, can't-sleep-without-them-by-my-side, money-making devices may be slowly killing you. And neither does the \$176 billion a year cancer drug industry (vaccines only manage half that revenue at about \$88 billion per year). By 2026, cancer drug sales are expected to almost double to \$320.6 billion.

Chemotherapy ain't cheap.

But the 2024 EMF Hazard Summit is. In fact, it's free to attend.

Nick Pinault, the “EMF Guy,” has brought together 20 doctors, scientists and researchers — who aren't being bribed by Big Tech or Big Pharma — to talk about the big dangers of EMF exposure and how to protect yourself (hint: don't sleep with your cellphone and laptop recharging beside your bed).

Jesus didn't save my assistant from cancer — just like he won't save you from an oncoming train if you stand on the tracks. Instead, he counselled that we should “be as wise as serpents and harmless as doves.”

The online event begins April 11th, but you can wisely register now and get instant access to Nick Pineault's free EMF guide (“6 Signs You Might be Electro-Sensitive”) [here](#).
