Last month we reported on how the CDC's proclamation that the U.S. is now facing a "pandemic of the unvaccinated" [was a lie](#), with no stats to back up this assertion.

They claimed that "99%" of those being hospitalized with COVID were "unvaccinated," even though reports and other stats proved just the opposite.

Even Republican Governors are perpetuating this lie to the American people. See: [Republican Governors Join Biden and CDC in Blaming "Unvaccinated" for Alleged New COVID Hospitalizations](#)

As regular readers of *Health Impact News* know, the U.S. Government has a tracking system to track reported injuries following vaccines, called "VAERS," the [Vaccine Adverse Event Reporting System](#).

Here is what they say about the Government vaccine reporting system, which is on the hhs.gov website:

About VAERS

Background and Public Health Importance

Established in 1990, the Vaccine Adverse Event Reporting System (VAERS) is a national early warning system to detect possible safety problems in U.S.-licensed vaccines. VAERS is co-managed by the Centers for Disease Control and Prevention (CDC) and the U.S. Food and Drug Administration (FDA). VAERS accepts and analyzes reports of adverse events (possible side effects) after a person has received a vaccination. Anyone can report an adverse event to VAERS. Healthcare professionals are required to report certain adverse events and vaccine manufacturers are required to report all adverse events that come to their attention.

VAERS is a passive reporting system, meaning it relies on individuals to send in reports of their experiences to CDC and FDA. VAERS is not designed to determine if a vaccine caused a health problem, but is especially useful for detecting unusual or unexpected patterns of adverse event reporting that might indicate a possible safety problem with a vaccine. This way, VAERS can provide CDC and FDA with valuable information that additional work and evaluation is necessary to further assess a possible safety concern.

[Source.](#)

The CDC and FDA typically add new cases of injuries and deaths following COVID-19 vaccines every week, and you can read about the latest data dump into VAERS from [this past weekend here](#).

As the U.S. Government admits above in the “About Us” section of VAERS, it is a “passive reporting system,” and “relies on individuals to send in reports of their experiences to CDC and FDA.”

So the big question has always been, just what percentage of actual vaccine injuries and deaths are represented in VAERS?

According to a report in 2011 that was prepared for the U.S. Department of Health and Human Services, less than 1%. See: [Less Than 1% of Vaccine Injuries Reported in the Government National Vaccine Adverse Event Reporting System](#)

The [last VAERS report](#) from this past weekend listed:

- 12,791 deaths
- 16,044 permanent disabilities
- 70,667 emergency room visits
- 51,242 hospitalizations
- 13,139 life threatening events

following COVID-19 shots.

But what about total injuries reported following these shots? They are listed as “symptoms” in the VAERS database, and I had never done a search on total symptoms reported following COVID-19 shots.

So I did one today, and the search result returned 2,604,121 reported symptoms from

571,831 cases. You can see the [results of the search here](#).

There are over 10,500 kinds of symptoms reported, and I copied that table into an Excel spreadsheet and sorted them from most reported symptoms to least, and the results are below.

To be fair, not all of the symptoms are injuries. They list some benign things such as lab tests, for example. But they are mostly injuries, because this is the purpose of the VAERS system, as the government admits. The purpose is to track injuries and deaths to see if there are any concerns.

The CDC says there are no concerns. The few concerns they do admit, they brush aside as “rare.” They claim blood clots, for example, are rare. ([Source](#).)

They come up with very low numbers for a serious adverse event by narrowly defining the symptom, and ignore all others.

For example, if you search the table below for “thrombosis,” the most common “symptom” for blood clots, you will find 80 different kinds of thrombosis, with around 10,000 reports, in a passive system that may only represent 1% of the population of COVID-19 vaccinated.

Does that sound “rare”?

When all these COVID-19 vaccinated people start suffering from blood clots, where do you think they go?

To the hospitals.

And yet the CDC, FDA, and politicians want us to believe that there is a “pandemic of unvaccinated” and that “99% of hospitalizations” right now are unvaccinated?

Their own stats prove they are all LIARS!

I don’t know if this article, or another one that reports something similar to this will go viral enough to attract the attention of the corporate media or Big Tech “fact checkers” who will come in and try to cherry pick something in the stats that they will claim “proves” this is false, but there is one thing that nobody can refute:

From these 571,831 cases and 2,604,121 reported symptoms, NOT A SINGLE ONE IS FROM SOMEONE WHO IS UNVACCINATED WITH COVID-19.
