In-depth Report: [Depleted Uranium, IRAQ REPORT](#)

Back in October, I [reported](#) that, "A type of airplane, the A-10, deployed this month to the Middle East by the U.S. Air National Guard's 122nd Fighter Wing, is responsible for more Depleted Uranium (DU) contamination than any other platform, according to the International Coalition to Ban Uranium Weapons (ICBUW). . . . Pentagon spokesman Mark Wright told me, 'There is no prohibition against the use of Depleted Uranium rounds, and the [U.S. military] does make use of them. The use of DU in armor-piercing munitions allows enemy tanks to be more easily destroyed.'"

This week I have left an email message and a phone message for Mark Wright at the Pentagon. Here's what I emailed, after consulting with Wim Zwijnenburg of [PaxForPeace.nl](#):

"Recent reports by CENTCOM have noted that 11% of the U.S. sorties have been flown by A-10s , and that a wide range of attacks on tanks and armored vehicles have taken place. Can you confirm that PGU-14 30mm munitions with depleted uranium in the A-10s (and any other DU weapons) have not been used during these attacks. And if not, why not? Thanks!"

I sent that email on January 28 and left a voice message January 30.

You'd think there'd be lots of reporters calling with the same question and reporting the answer. But then it's only Iraqis, I guess.
