

Poisoned Agriculture: Depopulation and Human Extinction

By [Colin Todhunter](#)

There is a global depopulation agenda. The plan is to remove the 'undesirables', 'the poor' and others deemed to be 'unworthy' and a drain on finite resources. However, according to Rosemary Mason, the plan isn't going to work because an anthropogenic mass extinction is already underway that will affect all life on the planet and both rich and poor alike. Humans will struggle to survive the phenomenon.

A new paper by Rosemary A Mason in the 'Journal of Biological Physics and Chemistry', indicates that a 'sixth extinction' is under way (the Holocene extinction, sometimes called the Sixth Extinction, is a name describing the ongoing extinction of species during the present Holocene epoch – since around 10,000 BCE). In her paper, 'The sixth mass extinction and chemicals in the environment: our environmental deficit is now beyond nature's ability to regenerate', she argues that loss of biodiversity is the most urgent of the environmental problems, as biodiversity is critical to ecosystem services and human health. And the main culprit is the modern chemical-intensive industrialised system of food and agriculture.

Mason asserts there is a growing threat from the release of hormone-disrupting chemicals that could even be shifting the human sex ratio and reducing sperm counts. An industrial agricultural revolution has created a technology-dependent global food system, but it has also created serious long-run vulnerabilities, especially in its dependence on stable climates, crop monocultures and industrially produced chemical inputs. In effect, farming is a principal source of global toxification and soil degradation.

Without significant pressure from the public demanding action, Mason argues there could little chance of changing course fast enough to forestall disaster. The 'free' market is driving the impending disaster and blind faith in corporate-backed technology will not save us. Indeed, such faith in this technology is actually killing us.

Since the late 1990s, US scientists have written in increasingly desperate tones regarding an unprecedented number of fungal and fungal-like diseases, which have recently caused some of the most severe die-offs and extinctions ever witnessed in wild species and which are jeopardizing food security. Only one paper dared to mention pesticides as being a primary cause, however.

Mason cites a good deal of evidence to show how the widespread use on agricultural crops of the systemic neonicotinoid insecticides and the herbicide glyphosate, both of which cause immune suppression, make species vulnerable to emerging infectious pathogens, driving large-scale wildlife extinctions, including essential pollinators.

Providing evidence to show how human disease patterns correlate remarkably well with the rate of glyphosate usage on corn, soy and wheat crops, which has increased due to 'Roundup Ready' crops, Mason goes on to present more sources to show how our over-reliance on chemicals in agriculture is causing irreparable harm to all beings on this planet. Most of these chemicals are known to cause illness, and they have likely been causing illnesses for many years. But until recently, the herbicides have never been sprayed directly on food crops and never in this massive quantity.

The depopulation agenda

Mason discusses how agriculture and genetically modified organisms (GMOs) fit into a wider agenda for depopulating the planet. She notes that on the initiative of Gates, in May 2009 some of the richest people in the US met at the home of Nurse, a British Nobel prize-winning biochemist and President (2003–10) of Rockefeller University in Manhattan, to discuss ways of tackling a 'disastrous' environmental, social and industrial threat of overpopulation. The meeting was hosted by David Rockefeller Jr. These same individuals have met several times since to develop a strategy in which population growth would be tackled.

The Rockefeller Foundation (RF) was involved in extensive financing of eugenics research in league with some of the US's most respected scientists from such prestigious universities as Stanford, Yale, Harvard and Princeton. The explicit aim of the eugenics lobby funded by wealthy elite families, such as Rockefeller, Carnegie, Harriman and others since the 1920s, has embodied what they termed 'negative eugenics', the systematic killing off of 'undesired bloodlines'.

RF funded the earliest research on GMOs, which Mason regards as part of the depopulation agenda. The RF funded the earliest research on GMOs in the 1940s and effectively founded the science of molecular biology.

Mason cites Steven Druker to show the fraud behind GMOs and how governments and leading scientific institutions have systematically misrepresented the facts about GMOs and the scientific research that casts doubt on their safety. Druker has shown that GMOs can have severe health impacts, which have been covered up.

The Royal Society is the preeminent scientific body within the UK that advises the government. It has misrepresented the facts about GMOs and has engaged in various highly dubious and deceptive tactics to promote the technology.

Druker wrote an open letter to RS as it has an obligation to the British public to provide a public response and 'put the record straight' on GMOs. Although Sir Paul Nurse's presidency of Rockefeller University terminated in 2010, after he assumed the Royal Society presidency, Mason notes that Nurse is said to have maintained a laboratory on the Rockefeller campus and has an ongoing relationship with the university.

She asks: is that why Sir Paul was unable (or unwilling) even to discuss GMOs with Steven Druker? Was he sent to London by the Rockefeller Foundation to support the UK Government in their attempt to bring in GM crops? The UK Government and the GM industry have after all been shown to be working together to promote GM crops and foods, undermine consumer choice and ignore environmental harm.

Mason then goes on to discuss the impact of glyphosate residues (herbicide-tolerant GM

crops are designed to work with glyphosate), which are found in the organs of animals, human urine and human breast milk as well as in the air and rivers. She documents its widespread use and contamination of soil and water and notes that the WHO International Agency for Research on Cancer's assessment of glyphosate being a 2A carcinogen (probably carcinogenic in humans) is unwelcome news for the agrochemical industry. She also notes that Roundup usage has led to a depletion of biodiversity and that loss of biodiversity is also correlated with neonicotinoids. However, despite the evidence, the blatant disregard concerning the use of these substances by regulatory agencies around the world is apparent.

To provide some insight into the impact on health of the chemical-intensive model of agriculture, Mason shows that in the US increases in Alzheimer's disease, obesity, breast cancer, oesophageal cancer, congenital anomalies and a growing burden of disability, particularly from mental disorders are all acknowledged.

She claims that plans are under way to depopulate the planet's seven million plus people to a more manageable level of between 500-2000 million by a combination of means, including the poisoning and contamination of the planet's food and water supplies via chemical-intensive industrialised agriculture. Mason also notes that health-damaging GMOs are being made available to the masses (under the guise of 'feeding the poor'), while elites are more prone to eat organic food.

We may be gone before planned depopulation takes hold

Although Mason cites evidence to show that a section of the US elite has a depopulation agenda, given the amount of poisons being pumped into the environment and into humans, the thrust of her argument is that we could all be extinct before this comes to fruition – both rich and poor alike.

In concluding, she states that the global pesticides industry has been allowed to dominate the regulatory agencies and have created chemicals of mass destruction that can no longer be controlled. She has some faith in systems biology coming to the fore and being able to understand the complexity of the whole organism as a system, rather than just studying its parts in a reductionist manner. But Mason believes that ultimately the public must place pressure on governments and hold agribusiness to account.

However, that in itself may not be enough.

It is correct to highlight the poisonous impacts of the Rockefeller-sponsored petrochemical 'green revolution'. It has uprooted indigenous/traditional agriculture and local economies and has recast them in a model that suits global agribusiness. It is poisoning life and the environment, threatening food security across the globe and is unsustainable. The 'green revolution' was ultimately a tool of US foreign policy that has been used in conjunction with various institutions like the IMF, World Bank and World Trade Organisation. GMOs represent more of the same.

In this respect, Mason follows the line of argument in William F Engdahl's book ['Seeds of Destruction: The Hidden Agenda of Genetic Manipulation'](#), which locates the GM issue and the 'green revolution' firmly within the context of empire. Engdahl also sees the Rockefeller-Gates hand behind the great GMO project to a sinister eugenicist strategy of depopulation.

Mason's concerns about depopulation therefore should not be dismissed, particularly given the record of the likes of the Gates and Rockefeller clans, the various covert sterility programmes that have been instituted by the US over the decades and the way agriculture has and continues to be used as a geopolitical tool to further the agendas of rich interests in the US.

To understand the processes that have led to modern farming and the role of [entities like Monsanto](#), we must appreciate the [geopolitics of food and agriculture](#), which benefits an [increasingly integrated global cartel](#) of finance, oil, military and agribusiness concerns. This cartel seeks to gain from war, debt bondage and the control of resources, regardless of any notions relating to food security, good health and nutrition, biodiversity, food democracy, etc.

Food and trade policy analyst Devinder Sharma notes the impacts in India:

"India is on fast track to bring agriculture under corporate control... Amending the existing laws on land acquisition, water resources, seed, fertilizer, pesticides and food processing, the government is in overdrive to usher in contract farming and encourage organized retail. This is exactly as per the advice of the World Bank and the International Monetary Fund as well as the international financial institutes."

In Punjab, India, pesticides have turned the state into a '[cancer epicentre](#)'. Moreover, [Indian soils are being depleted](#) as a result of the application of 'green revolution' ideology and chemical inputs. India is losing 5,334 million tonnes of soil every year due to soil erosion because of the indiscreet and excessive use of fertilisers, insecticides and pesticides. The Indian Council of Agricultural Research reports that soil is become deficient in nutrients and fertility.

And now, there is an attempt to [push GM food crops into India](#) in a secretive, non-transparent manner that smacks of regulatory delinquency underpinned by corrupt practices, which suggests officials are working hand in glove with US agribusiness.

As smallholders the world over are being [driven from their land](#) and the GMO/chemical-industrial farming model takes over, the problems continue to mount.

The environment, the quality of our food and our health are being sacrificed on the altar of corporate profit and a type of looting based on something we can loosely regard as 'capitalism'. The solution involves a shift to organic farming and investment in and reaffirmation of indigenous models of agriculture. But ultimately it entails what [Daniel Maingi](#) of Growth Partners for Africa says what we must do: "... take capitalism and business out of farming."

It must also entail, according to Maingi, investing in "... indigenous knowledge and agroecology, education and infrastructure and stand(ing) in solidarity with the food sovereignty movement."

In other words, both farmers and consumers must organise to challenge governments, corrupt regulatory bodies and big agribusiness at every available opportunity. If we don't do this, what Mason outlines may come to pass.
