On December 16, 2021, ICAN, through its attorneys, issued a Freedom of Information Act [request](#) to the CDC seeking any documents reflecting why a certain [VAERS report](#) was no longer available in the VAERS database. The report described an extremely disturbing incident wherein a two-year-old boy "began bleeding out of the mouth, eyes, nose and ears within six hours" of his first dose of Pfizer's COVID-19 vaccine on November 18, 2021, and died later that night. On February 14, 2022, the CDC finally [responded](#) to ICAN's request, stating: "A search of our records failed to reveal any documents pertaining to your request."

Significantly, the CDC has made [repeated assurances](#) that "COVID-19 vaccines are being administered under the most intensive vaccine safety monitoring effort in the United States' history." The CDC's [VAERS Standard Operating Procedures for COVID-19](#) even states that the "CDC will perform clinical reviews" for certain "Adverse Events of Special Interest," which include death, "especially in children (<18 years of age) and recipients of newly licensed vaccines)."

But despite all of these claims of about the unprecedented level of "intensive" safety monitoring of these vaccines, the CDC claims to have no records that would explain why a VAERS report describing the horrific death of a toddler suddenly disappeared from the primary government-funded system for reporting adverse vaccines reactions in the United States, VAERS—a system of which the CDC is a [co-sponsor](#).

ICAN intends to get to the bottom of the disappearance of this deeply disturbing report and will persist in holding the CDC accountable for its purported claims of intensive vaccine safety monitoring.
