*Ironically, the incidence of the SARS-CoV-2 Delta Variant which is “detected” by the totally invalid RT-PCR test (routinely tabulated by the health authorities) is significantly higher for vaccinated individuals. Why?*

This should be obvious. It is a simple issue of categorization.

A vaccinated individual who goes home and then a week or two later feels sick will seek medical attention at a health clinic or at the hospital where he/she was vaccinated. This individual will invariably be subjected to a medical diagnosis as well as to a routine RT-PCR test.

It's statistics 101. It pertains to “probabilities”.

The probability of a vaccinated individual suffering from adverse effects (seeking medical attention) being subject to the PCR-test (in a clinic or a hospital) is much higher than that pertaining to a healthy unvaccinated individual.

Moreover, there is rising trend in vaccine deaths and injuries which the health authorities are anxious to obfuscate.

There is a lot of nonsense published on this matter.

Ask yourself. What is the cause of this trend among the vaccinated? The SARS-2 Delta Variant or the Killer Vaccine?

The vaccinated person subjected to the flawed RT-PCR test is categorized as “positive” or is diagnosed as a “probable” Covid-19 positive. And the numbers of covid positive cases assigned to the “vaccinated” go fly high.

In turn, in the US, the “certifiers” are instructed to indicate Covid-19 as “the underlying cause of death” “more often than not”. And no autopsy is allowed.

The deaths and injuries resulting from the mRNA vaccine are now being assigned to the “deadly” SARS-2 Delta Variant.
