

There Is No Debate: Vaccine Data Is Largely Based on Research Fraud and Intimidation of Scientists

When pro-vaccine scientists and skeptics claim that they believe what they believe because of “science,” it’s important to remember that much of what is assumed to be science today is actually pseudoscience for the promulgation of special interests. Concerning vaccines, it continues to come to light that many of the studies and research projects upon which regulators bought into the vaccine agenda were manipulated, faked or otherwise tampered with to push an agenda.

This is especially true about the MMR vaccine for measles, mumps and rubella, which currently dominates news headlines amidst widespread fears over measles. Government spokespersons, media correspondents, celebrities and others are urging everyone, young and old alike, to march down to their local pharmacy and get an MMR vaccine, which they insist will provide protection against the threat of infection.

But is this actually true? Both the safety and efficacy of the MMR vaccine have been called into question on numerous occasions, including late last summer when U.S. Centers for Disease Control and Prevention (CDC) whistleblower Dr. William Thompson came forward with information about how the MMR *had* been shown to cause autism in children, and particularly African American children. The government tried to conceal this data from the public, but Thompson bravely brought it to light in a move that could cost him his career.

More recently, it was brought to our attention that a lawsuit had been filed against Merck & Co., the maker of the MMR II [vaccine](#) currently administered to U.S. children as part of the CDC’s official vaccination schedule. Filed under the False Claims Act, the shocking suit by two former Merck scientists alleges that Merck manipulated early trial data on the MMR to make it appear safe and at least 95 percent effective, allowing it to receive a U.S. Food and Drug Administration (FDA) endorsement.

Time and time again, vaccine manufacturers have been caught massaging the numbers, altering study criteria and even tampering with study subject matter, including blood samples and test subjects, in order to achieve a desired outcome. It doesn’t matter if a vaccine *actually* works or is safe — as long as the data can be adjusted or changed to create the illusion, the government and the public seem to have no problem accepting the official narrative.

“It cannot be denied that today’s mandatory childhood vaccine programs are little more than blind experiments with the possibility of unthinkable and irreversible consequences for our children’s physical, mental, and emotional health in the future,” wrote Dr. Harold E. Buttram, M.D., and Catherine J. Frompovich. Catherine J. Frompovich

about the issue. “The time is long overdue for a complete reevaluation of the current vaccine formulations and programs.”

Vaccines directly spread the diseases they are claimed to prevent, science shows

The MMR vaccine has long been a source of controversy ever since gastroenterologist Dr. Andrew Wakefield reported on an unusual bowel condition that he and his colleagues observed in direct conjunction with the jab. The study, which was originally published in *The Lancet*, sparked a global debate in which the vaccine establishment has ever since had to aggressively brainwash the public just to stay in business.

But there’s simply no denying that the MMR isn’t nearly as safe as Merck and the government claim it is. This is evidenced not only by previously concealed information about its dangers brought to light by Dr. Thompson and the two former Merck scientists but also by Merck’s own admissions in the MMR II package insert that the vaccine can cause serious, life-threatening conditions like:

- Vasculitis (inflammation of the blood vessels)
- Pancreatitis (inflammation of the pancreas)
- Diabetes
- Thrombocytopenia (low blood platelet count)
- Chronic arthritis
- Encephalitis (inflammation of the brain)
- Panniculitis (inflammation of the subcutaneous fat layer)

Several of these conditions are directly brought about by the live viruses contained in the MMR, including encephalitis, which is also a marker of autism. Even the mainstream media is now acknowledging [measles](#) encephalitis as a risk factor, though sources are associating this condition with wild measles as opposed to atypical vaccine-induced measles.

Then there’s the issue of permanent, lifelong immunity, something that can’t be achieved with any vaccine. In fact, vaccines eliminate all possibility of a person developing lifelong immunity to infectious diseases like measles because they circumvent innate immunity, the body’s first line of defense against disease, exposing the adaptive immune system to viral components that it would never otherwise encounter.

This causes permanent damage to the immune system and helps explain why many people today are stricken with autoimmune disorders that prior to vaccines were virtually nonexistent. What the media isn’t telling you is that natural exposure to measles, for instance, is generally mild and imparts permanent immunity — it is nature’s vaccine, without all the chemicals and heavy metals.

“Whereas natural recovery from many infectious diseases usually stimulates lifetime immunity, vaccines only provide temporary protection and most vaccines require ‘booster’ doses to extend vaccine-induced artificial immunity,” said National Vaccine Information Center (NVIC) President Barbara Loe Fisher.
