

U.S. Centers for Disease Control (CDC) Liars: “1 Million Ebola Cases by January”

By [Jon Rappoport](#)

In [“WHO: 21,000 Ebola cases by November if no changes”](#) (AP/USA Today), 9/22, there is this:

“CDC scientists...also predict that the two countries [Sierra Leone and Liberia] could have a staggering 550,000 to 1.4 million [Ebola] cases by late January.”

CDC employees don’t know they’re alive unless they’re lying.

And many of those lies are launched in order to promote vaccines. Shiny new Ebola vaccine, anyone?

[The CDC made up one of these astonishing lies in the fall of 2009](#). Swine Flu, a dud of an epidemic, was the topic then.

Sharyl Attkisson, at CBS News, had just torn the CDC to pieces with her investigation, which uncovered the fact that [the CDC had stopped counting cases of Swine Flu](#). The real reason? The overwhelming number of blood samples from likely Swine Flu patients showed no sign of Swine Flu or any flu.

The hoax of an epidemic had been revealed.

So what did the CDC do? They doubled down. They told a galactic lie.

Let’s go over the Swine Flu debacle, piece by piece:

Swine Flu? The dreaded H1N1 virus? It was the “Ebola” of 2009. The whole world was going to be infected. The World Health Organization declared it a “level-6 pandemic,” their most dangerous category.

The US Centers for Disease Control was turning out press releases like hot cakes, churning up fear, promoting the Swine Flu vaccine.

The CDC had one official job: letting the press know, up to the minute, how many cases of Swine Flu there were in the US.

That was their only real job.

If they couldn’t get that one right, they had no reason to exist.

How did the CDC decide how many cases of Swine Flu existed? They took reports from health agencies in the 50 states and they added them up.

Not exactly rocket science. You could say any idiot could perform that task.

Well, along came Sharyl Attkisson, and she exploded a bombshell:

"If you've been diagnosed 'probable' or 'presumed' 2009 H1N1 or 'swine flu' in recent months, you may be surprised to know this: odds are you didn't have H1N1 [Swine] flu. In fact, you probably didn't have flu at all.

"That's according to state-by-state test results obtained in a three-month-long CBS News investigation.

"In late July, the CDC abruptly advised states to stop testing for H1N1 [Swine] flu, and stopped counting individual cases. The rationale given for the CDC guidance to forego testing and tracking individual cases was: why waste resources testing for H1N1 flu when the government has already confirmed there's an epidemic?

"...we [CBS News] asked all 50 states for their statistics on state lab-confirmed H1N1 [Swine Flu cases] prior to the halt of individual testing and counting in July. The results reveal a pattern that surprised a number of health care professionals we consulted. The vast majority of cases were negative for H1N1 as well as seasonal flu, despite the fact that many states were specifically testing patients deemed to be most likely to have H1N1 flu, based on symptoms and risk factors, such as travel to Mexico." (cbsnews.com, October 21, 2009, ["Swine Flu Cases Overestimated?"](#))

The CDC exposure was titanic, even if many readers didn't get the point:

The CDC had stopped counting the number of Swine Flu cases in America, by blithely assuming there was an epidemic; and therefore, its job was done.

But that was a naked lie. The CDC had actually stopped counting cases because the tests of patients who most likely had Swine Flu didn't have Swine Flu at all, and most of them didn't have any kind of flu. In other words, the whole Swine Flu "epidemic" was a bust. A dud.

This was apparent from Attkisson's article.

The CDC was lying through its teeth.

And the staggering capper on this tale? Roughly three weeks after Attkisson's Swine Flu revelations appeared in print, the CDC, obviously in great distress over the exposure, decided to double down. The best lie to tell would be a huge lie.

Here, from a November 12, 2009, WebMD article is the CDC's response: "Shockingly, 14 million to 34 million U.S. residents — the CDC's best guess is 22 million — came down with H1N1 swine flu by Oct. 17 [2009]." (["22 million cases of Swine Flu in US,"](#) by Daniel J. DeNoon)

In other words, leaping from overblown and false reports of tens of thousands of Swine Flu cases in American, the CDC was now saying that roughly 1 out of every 14 Americans had Swine Flu—when their own tests showed the overwhelming number of people presumed to

have Swine Flu didn't have it at all.

I interviewed Sharyl Attkisson. She told me the following:

"...we discovered through our FOI efforts that before the CDC mysteriously stopped counting Swine Flu cases, they had learned that almost none of the cases they had counted as Swine Flu was, in fact, Swine Flu or any sort of flu at all! The interest in the story from one [CBS] executive was very enthusiastic. He said it was 'the most original story' he'd seen on the whole Swine Flu epidemic. But others [at CBS] pushed to stop it and, in the end, no [CBS television news] broadcast wanted to touch it. We aired numerous stories pumping up the idea of an epidemic, but not the one that would shed original, new light on all the hype. It [Attkisson's investigation] was fair, accurate, legally approved and a heck of a story. With the CDC keeping the true Swine Flu stats secret, it meant that many in the public took and gave their children an experimental vaccine that may not have been necessary."

Trust government pronouncements about diseases?

Are you serious?
