Representatives of the civil-military administration of the Zaporozhie region denounced today that Ukrainian troops use artillery with NATO ammunition in attacks on the Energodar nuclear power plant.

“The latest attacks on Saturday were carried out with 155-millimeter shells of the North Atlantic Treaty Organization (NATO) with American M739 fuses,” the Ukrainian oblast authorities reported on their Telegram account.

In this regard, the member of the main council of the Zaporozhie oblast administration Vladimir Rogogov confirmed that long-range weapons were used in the aggression from the opposite side of the Dnieper River.

The Russian Defense Ministry warned last Thursday that Kiev troops would stage a provocation to generate a radiation leak, as well as to break the integrity of the nuclear waste repository and put the reactor in an abnormal operating state.

The portfolio specified that the aim of such action would be to create an exclusion zone of up to 30 kilometers and to blame Russia for nuclear terrorism, in order to justify a further escalation of the conflict. Several Western politicians stated that a radiation leak at the Zaporozhie nuclear power plant as a result of the shelling could be a pretext for the Atlantic Alliance to start participating in the fighting in Ukraine.
