

The Vaccinated Are Getting Sick at High Rates as Scientists Are Clueless As to Why

It seems that those who have taken the Covid-19 experimental injections several months ago are starting to become seriously ill. [Chicago's WGN9](#) reported that “The Rev. Jesse Jackson Sr. and his wife, Jacqueline Jackson have both tested positive for COVID-19 and are hospitalized at Northwestern Memorial Hospital, according to a statement from Rainbow PUSH Coalition.” The report mentioned that he “was vaccinated against Covid-19 in early January.”

Jackson is a well-known activist in the US who believed in Big Pharma’s miracle cure against Covid-19 and now he is suffering from the consequences of not doing the research on the dangers of the experimental injections. In an interesting twist to the mainstream media’s reporting on the Covid-19 experimental injections, *Bloomberg News* headlined with a disturbing title for its readership, [‘The Vaccinated Are Worried and Scientists Don’t Have Answers’](#) said that the

“Anecdotes tell us what the data can’t: Vaccinated people appear to be getting the coronavirus at a surprisingly high rate. But exactly how often isn’t clear, nor is it certain how likely they are to spread the virus to others.”

This is what good doctors and scientists from all over the world have been warning us about since the experimental injection was released under Operation Warp Speed. But the mainstream media continues its relentless defense of the medical establishment as it makes the case that the experimental injection offers “powerful protections” against Covid-19 “it is evident vaccination still provides powerful protection against the virus”, then admits that “there’s growing concern that vaccinated people may be more vulnerable to serious illness than previously thought.”

All I have to say is wow! The following is an admission that the so-called vaccine is a disaster in the making especially for those who blindly rushed to become Big Pharma’s guinea pigs. A former director from the *Centers for Disease Control* (CDC), Dr. Tom Frieden can’t even give a clear answer to any questions for those who were already vaccinated on how they can protect themselves or if they will need a booster shot in the near future:

There’s a dearth of scientific studies with concrete answers, leaving public policy

makers and corporate executives to formulate plans based on fragmented information. While some are renewing mask mandates or delaying office reopenings, others cite the lack of clarity to justify staying the course. It can all feel like a mess.

“We have to be humble about what we do know and what we don’t know,” said Tom Frieden, a former director of the Centers for Disease Control and Prevention and the head of the nonprofit Resolve to Save Lives. “There are a few things we can say definitively. One is that this is a hard question to address.”

Absent clear public health messaging, vaccinated people are left confused about how to protect themselves. Just how vulnerable they are is a key variable not just for public health officials trying to figure out, say, when booster shots might be needed, but also to inform decisions about whether to roll back reopenings amid a new wave of the virus. On a smaller scale, the unknowns have left music lovers unsure if it’s OK to see a concert and prompted a fresh round of hang-wringing among parents pondering what school is going to look like

Mass confusion is coming soon as more people who have already taken the experimental injection are becoming sick. The authors of the article, Kristen V. Brown and Rebecca Torrence add several case studies of *“breakthrough infections”* that makes understanding the after-effects of the experimental injections a bit more confusing:

In lieu of answers, what has emerged is a host of case studies providing somewhat different pictures of breakthrough infections. Variables including when the surveys were conducted, whether the delta variant was present, how much of the population was vaccinated and even what the weather was like at the time make it hard to compare results and suss out patterns. It’s difficult to know which data might ultimately carry more heft.

“It’s quite clear that we have more breakthroughs now,” said Monica Gandhi, an infectious disease expert at the University of California, San Francisco. “We all know someone who has had one. But we don’t have great clinical data”

The article does mention the Fourth of July celebrations in the beach town of Provincetown, Massachusetts where both the vaccinated and unvaccinated partied and found that *“three-fourths of the 469 new infections occurred were among the vaccinated people”*:

Authors of a CDC case study said this might mean that they were just as likely to transmit Covid-19 as the unvaccinated. Even so, they cautioned, as more people are vaccinated, it’s natural that they would also account for a larger share of Covid-19 infections and this one study was not sufficient to draw any conclusions. The incident prompted the CDC to reverse a recommendation it had issued just a few weeks earlier and once again urge the vaccinated to mask up in certain settings

Here is where they use Israel’s research that suggests that the experimental injections wane after several months:

Research out of Israel seems to back the idea that protection from severe disease wanes in the months after inoculation, and more recently, that breakthrough cases may eventually lead to an uptick in hospitalizations. The information is preliminary and severe breakthrough cases are still rare, but it bolsters the case that some people will

need booster shots in coming months.

Case studies and data from some states in the U.S. have similarly shown an increase in breakthrough cases over time. But with the delta variant also on the rise, it's difficult to tell whether waning immunity to any type of coronavirus infection is to blame, or if the vaccinations are particularly ineffective against the delta variant. It could be both, of course. Changing behavior among vaccinated people could be a factor, too, as they return to social gatherings and travel and dining indoors

In typical propaganda fashion, the Bloomberg authors basically blame the unvaccinated for the uptick in breakthrough cases:

All that said, some facts are well established at this point. Vaccinated people infected with the virus are much less likely to need to go to the hospital, much less likely to need intubation and much less likely to die from the illness. There's no doubt that vaccines provide significant protection. But a large proportion of the nation — almost 30% of U.S. adults — have not been vaccinated, a fact that has conspired with the highly contagious delta variant to push the country into a new wave of outbreaks

Well, the Reverend Jesse Jackson may disagree with that statement now since he and his wife are hospitalized with a new round of Covid-19 delta variant despite the fact that he allowed the medical establishment to convince him that new mRNA experimental injections would protect him and his family. Bloomberg's article ends with a clear indication that the doctors and scientists that promoted the vaccine and in most cases, are in the pockets of Big Pharma such as Dr. Tom Frieden do not know what is going on:

For the time being, there are simply more questions than answers. Are breakthrough infections ticking up because of the delta variant, waning immunity or a return to normal life? Are vaccinated people more vulnerable to severe illness than previously thought? Just how common are breakthrough infections? It's anyone's guess.

"It is generally the case that we have to make public health decisions based on imperfect data," Frieden said. "But there is just a lot we don't know"

However, there are numerous good doctors and scientists who have not sold their souls to the devil that have sounded the alarm about the dangers associated with the experimental injections such as [Doctors for Covid Ethics](#) who wrote an urgent open letter to the European Medicines Agency in March 2021. Here is what they said:

As physicians and scientists, we are supportive in principle of the use of new medical interventions which are appropriately developed and deployed, having obtained informed consent from the patient. This stance encompasses vaccines in the same way as therapeutics.

We note that a wide range of side effects is being reported following vaccination of previously healthy younger individuals with the gene-based COVID-19 vaccines. Moreover, there have been numerous media reports from around the world of care homes being struck by COVID-19 within days of vaccination of residents. While we recognise that these occurrences might, every one of them, have been unfortunate coincidences, we are concerned that there has been and there continues to be inadequate scrutiny of the possible causes of illness or death under these

circumstances, and especially so in the absence of post-mortems examinations.

In particular, we question whether cardinal issues regarding the safety of the vaccines were adequately addressed prior to their approval by the European Medicines Agency (EMA)

The warnings were loud and clear from the start, but Big Pharma, the mainstream media and the rest of the political establishment ignored those who predicted the consequences from their so-called “vaccines” because they wanted to control the narrative and the profits associated with it. There is just too much too loose for the establishment since the real agenda is not to make the world a healthy place for humanity, but to rule the entire planet through coercive measures and it is called medical tyranny.
